

Design Cleaning contractors

Design Cleaning are the buildings main cleaning contractor and have carried out the following measures to ensure that our building is a safe place to be in:

- They have deep cleaned all surfaces in your communal areas (reception, toilets, staircase) using a strong disinfectant which also kills Coronavirus.
- They have also been running the taps and flushing the toilets each visit to prevent legionella.
- They have deep cleaned all carpets.
- They have deep cleaned the reception porcelain floors and sealed them with a non-slip coating.
- Since the deep clean took place they have been applying a layer of probiotics on all of our surfaces and touchpoints during each visit.

Why is this better than simply disinfecting?

In short, when they disinfect a surface, they eliminate ALL bacteria, good and bad. This creates a void that will be filled on a "first-come, first-served" basis by either good or, most likely bad bacteria. So what they do is fill the surface with good bacteria so that they don't leave much space or food for the bad ones to thrive (they both feed off dirt and grime). In the long-run, this is a much healthier and more hygienic way of cleaning a surface. It is also 100% eco-friendly :)

They are also in the final stages of upgrading our solutions so that they will include Prebiotics. Prebiotics are nutrients for the probiotics which help keep them alive for longer (they won't starve even if the surface is clean) and help them multiply.
